

The Vellasio System

Copyrite © James Michael Quigley 200

Layed before you here today may be the greatest roulette system you will ever read. For a roulette system to be successful it must work in 2 ways:

1. the short term

2. the long term

There are endless amounts of roulette systems out there that work in the short term, but fail miserably in the long term. It is the major flaw of just about every system out there.

Placing a quick bet and leaving is a great way to win at roulette, however you would not need a system for this, just a little luck. And this is where your short term victory's come into play

A roulette system is designed to help you win in the short run and the long run. However a problem with roulette systems these days is that they do neither.

Many roulette systems combine a ton of jibberish and complication that makes it unreadable. They add "fluff to a system" so it seems that you are getting more for your money. They add in symbols and pictures and all other kinds of nonsense that does not relate to there system.

So what I am gonna do is get right down to the point.

First off, as I said before a roulette system must win long term and short term.

Secondly, a roulette system is based upon 2 theory's:

You are waiting for a certain number or group of numbers to NOT appear for a certain amount of spins and then you are required to bet on them

The second theory is that you continually bet on each spin, but if you get a loss, you will increase your bets on the next spin.

I will tell you right now that the most inspiring system and perhaps the greatest system is when you bet on 2 of the 3 dozens.

You place 1 unit on 2 of the 3 dozens and cover nearly 66% of the board. If you get a hit on the 2/3rds of the board your covering then you profit one unit.

This is by far the greatest technique for playing roulette. It really works and if you can get a few wins in a row then you are set for the day. Unfortunately with this system there is a flaw. If you get a loss after 2 wins in a row then you are right back to where you started because you would have lost your previous 2 winnings. So if you played this system out you will always end up breaking even in the end. Of course when you add in the house edge you will actually be down about 5% of your starting bankroll.

However I would still recommend this system as a great hit and run strategy because you are covering 2/3rds of the board and have a great shot to profit.

But now, what if there was a way to cover more of the board and increase our success of making a profit.

You may have seen some of the other systems out there such as Donny Millionaires "win on every spin system" where he tells you to cover every number but 1.

So here you will risk \$35 to win only \$1. That is obviously not logical. A good rule of thumb when playing roulette or analyzing a new system is that you never want to risk more than double what your expected winnings are.

So now lets break down my system:

In order to gain more coverage of the table without producing some insane system such as betting on every number, we must use groups of numbers. This will minimize our total bet and provide less risk.

One group we will be betting on is the second half (18 numers). The other is the first dozen (12 numbers). Or you can reverse it and bet the first half and the third dozen.

A closer look at the table will reveal that we are coverig 84% of the board, a huge increase from the 2 dozens system I mentioned earlier. And the beauty is that we are only placing 2 bets. We cover about 20% more of the board than the 2 dozens system, making this a far supeirior bet

The Gameplay:

For a smaller bankroll I recommend placing \$20 on the second half and \$10 on the first column. A hit on the second half will win us \$10. A hit on the first column will break even. You will always need to be placing a 2:1 ratio for our bets. So, either \$10 on the second half and \$5 on the first dozen, or \$50 on the second half and \$25 on the first dozen.

If the ball lands on the 7 numbers we are not covering then you will lose your whole bet. A progressive method could be used to recover any losses, but that gets very risky. Progressive methods are well known to destroy an entire bankroll after only a few losses. One way to avoid needing to add a progression is to use wheel tracking. I used to progress on my units after a loss but I found a

way to not need to do that because I wouldn't get losses. I didn't get losses, because I used proper wheel tracking.

As I mentioned on the first page, one aspect of a roulette system is wheel tracking. So now we will add this to our system. We will only place our bets after the ball lands in 7 uncovered numbers for 2 consecutive spins. This is not uncommon and you will not need to wait long. This will just prove as an added safety measure. You will not place any bets until you have seen the ball land in the uncovered numbers for 2 consecutive spins. After you place your bets after the ball landed in the uncovered numbers, the chances that the ball will land there again is .4%. From there, its game on!

You can bet 2 units on the first half and 1 unit on the 3rd dozen. You are actually waiting for 2 consecutive hits on the double street (or the 6 numbers plus the zero) we are not covering in between the first half and the 3rd dozen. So if the ball lands on the dozen that you are covering and you keep breaking even, you will want to **keep on betting till you get 3 consecutive hits in the large group you are covering(either the second or first half)**. Remember that is the first half or the second half that is making us our money. So when you get 3 consecutive hits in this area then stop betting!!!! Spin the wheel without betting and wait for the ball to land in the uncovered numbers for 2 consecutive spins, then proceed with the system. Remember once you see the ball has landed in the uncovered area 2 consecutive times, you will start betting with 1 unit on the first dozen and 2 units on the second half, **you will only stop betting until the ball has landed in the second half for 3 consecutive spins.**

EXAMPLE: If the ball lands in the first dozen twice, and then the second half twice....you should keep betting because the ball has not yet landed in the second half 3 consecutive times....If it bounces back between the first dozen and the second half then you

will be rapidly increasing your bankroll. **If the ball lands in the uncovered area during your session, in the middle of your play, then don't worry, just continue your bets** When beginning your session, waiting for those 2 hits may take a while, so you can wait for only 1 consecutive hit. I have had tremendous success playing that way.

This Is The Technique Right Here That Changed My Life

There is also a higher bankroll bet that is recommended after you have built your bankroll up.

You will place \$200 on the second half and \$100 on the first column. A hit on the second half will win you \$100 and a hit on the first dozen will break even. After only a couple hits on the second half and you are set for the day. I would suggest a target mark around \$1000 for the day. Once you hit \$1000 you should stop.

Now before you place your \$300 bet I highly recommend that you wait for 2 consecutive hits on the 7 numbers we are not covering. This is highly recommended when you risk \$300 on one bet. By waiting for these 2 consecutive hits in any of the 7 numbers we do not cover, we almost ensure ourselves of winning \$100 on the next spin. Once again the chance that the ball will land in the uncovered numbers for a 3rd consecutive turn is .4%

The Mathematics Behind The System

So now lets have a look at the precise mathematics behind our system to fully understand it.

As you know we are leaving 7 numbers uncovered. Those 6 numbers are called the double street, and of course there is the zero. They are the 2 vertical columns containing 3 numbers in each column for a total of 6 numbers each.

The probability that the double street will *hit one time* is: 16%

The equation: $6/36 = .162$ or 16%

The probability that the double street will *hit twice in a row* is: 2.6%

The equation: $.162 \times .162 = .026$

The probability that the double street will *hit three times in a row* is: .4%

The equation: $.162 \times .162 \times .162 = .0042$

So, during the play of the system, while we are betting the dozen and the half, our only fear is that the ball will land in the uncovered numbers. As you can see from the equations above, there is a 16% chance that the ball will land in these numbers. If the ball does land there, then don't worry and continue your betting because the chance of the ball landing there again is 2.6%. In the very extreme scenario that the ball landed there twice in a row, then the chance the ball will land there a third time is .4%. A very miniscuel figure to never need to worry about.

This is a very powerful system and it does work. As your bankroll builds you can move up to higher levels, such as betting

\$800 on the second half and \$400 on the first column. A hit on the second half wins you \$400 and you break even with a hit on the first column.

As you increae your bets, you must increase the amount of times you wait for the ball to land on the 7 numbers we are not covering. Depending on your patience level, I suggest waiting 2 or 3 hits in the uncovered numbers before betting \$200 and \$100. If you are betting \$400 and \$200 , I would wait for 3 or 4 hits in the uncovered numbers. If you are betting at extremly high units above \$400 then wait 4 or more spins in the uncovered numbers. I do realize that it could be a very long time before you get a hit of 4 consecutive spins in the 7 numbers, so I have played only 2 hits and have had success. So no matter what level you play at just wait 1 or 2 hits in the uncovered numbers before placing youre bets. If you do have a ton of patience then wait around 4 hit in the 7 numbers.

Also be sure to only play at a European roulette table because they only have one zero which minimizes the house edge. Betvoyager casino has a roulette wheel without a zero so there is no house edge. If you are outside of the US then be sure to play at that casino. Another very unique casino is Virgin Casino. They have special roulette table with bonus zones on the wheel.
